

Symptoms at first are mild and gradually worsen over time.

Symptoms of venous disease include:

What is Venous Disease Caused by?

History of blood clots can cause post-thrombotic syndrome or superficial thrombophlebitis

Venous compression or obstruction may be caused by May-Thurner Syndrome

Incompetent valves and veins, venous insufficiency or pelvic congestion syndrome

What puts you at an increased risk for Venous Disease?

- Genetics:** Family history of venous disease
- Aging:** Age increases the likelihood of developing venous disease
- Gender:** Females are at a slightly higher risk, as well as during pregnancy
- Previous damage to your leg due to blood clots, injury, or surgery**
- Smoking history**
- Sitting or standing for prolonged periods**

There are different types of venous disease; depending on the severity and cause of symptoms, a proper evaluation and treatment will be recommended for you.

Obesity

What is Chronic Venous Disease

Chronic venous disease (CVD) is a common condition where the veins in your legs have trouble sending blood back to your heart.

There are different causes and mechanisms of venous disease arising mainly from obstruction (outflow obstruction), reflux (valve incompetence), or a combination of both, causing high venous pressure and dilation of veins.
